WHAT IS PAD?

PAD (Peripheral Artery Disease) is a chronic condition where the buildup of plaque in the arteries leads to decreased bloodflow to the extremities, typically the legs.

+200 million

How prevalent is PAD?

As of 2010, it was estimated that worldwide, 202 million were living with PAD. Common risk factors include age, smoking, obesity, & diabetes.

How are patients affected?

If untreated, PAD can lead to leg pain, slow-healing wounds, infection, amputation or stroke.

The PADnet advantage

- Non-invasively identifies disease in arteries and veins
- Supports screening and advanced diagnostics
- Comes with a mobile health assessment platform that enables secure community-based collaboration
